Hiring Team & Founders
Crucibl
San Francisco, CA

Dear Crucibl Team,

I am writing to express my strong enthusiasm for the **Member of Technical Staff** role at Crucibl. Management consulting's $400B model of selling human intelligence-for-hire is overdue for structural disruption. The real frontier in enterprise AI is not just incremental model tuning—it is executing judgment at scale and turning messy, unstructured business problems into defensible, high-velocity decision engines. As a technical founder and systems builder who thrives in 0-to-1 ambiguity, that mission directly reflects the systems I build.

At Novalyte AI, I built complete 0-to-1 data ingestion and AI agent pipelines from the ground up. I architected Cloud Run-ready MCP services that extract unstructured market signals, orchestrate LLM reasoning workflows with strict Pydantic structured validation, and synchronize real-time state across Supabase/Postgres and BigQuery data layers. Before that at Zendesk, I engineered enterprise workflow architectures and data telemetry systems for North American revenue operations.

Here is what I bring to Crucibl's founding engineering team:

- **Full-Stack Systems Ownership:** Experience designing end-to-end data ingestion, API layers, reasoning pipelines, and database sync without requiring hand-holding or rigid specifications.
- **Applied AI & Structured Extraction:** Deep practical expertise building LLM reasoning tools, MCP agent protocols, prompt architectures, and deterministic data validation pipelines.
- **Enterprise Speed & Quality:** A relentless focus on shipping production systems directly to enterprise clients, combining fast prototyping with robust data integrity.

I am based in San Francisco, excited about your hybrid 3-day in-office culture, and eager to partner with your founders to build the definitive AI judgment platform for the global economy. I would welcome the opportunity to connect.

Sincerely,
Jamil Yakasai
